

1. Brief summary of the activities in the last two weeks

We all took about a week to catch back up on where we left off at the end of spring. Jordan and Andrew began working on hardware side of things, specifically setting up the GATT protocol for communication between the devices and the app. Josh ordered some more parts for us to work with so that we can start assembling a prototype of the finished product. Stefan has been working on the app side of things, specifically creating a debug log for when we start to combine hardware and software side of development. There is an emulator for the app already set up in Android Studio and Bluetooth development beginning.

2. Status-summary of the extra credit homework(s) that are due week#10

Each team member is currently looking up an article and the goal is to come up with our own ideas and then come together as a group and put each of our ideas and summaries together.

3. Any exceptions that could affect the demo/presentation1

Not at the moment, but will let you and our adviser know via email, if something should come up during development.

4. Any items more-remotely related to the project that need to be discussed

None so far.
